DESCRIPTION OF THE FIELD

Hemostasis is a function of the physiological processes which initiate and modulate blood coagulation and fibrinolysis. Blood coagulation involves a series of highly complex, inter-related proteolytic events which culminate in the formation of a fibrin clot surrounding the platelet aggregate which makes up the primary hemostatic plug that forms to prevent loss of blood when a vessel is damaged. Fibrin is the product of a proteolytic reaction catalyzed by thrombin, a serine protease, which in turn is the product of a proteolytic activation of prothrombin by factor Xa, also a serine protease. Thrombin also is a potent activator of platelet aggregation.

Factor Xa is converted from inactive factor X by two distinct mechanisms referred to as the intrinsic and extrinsic coagulation pathways. The intrinsic pathway comprises a series of proteolytic reactions catalyzed by factors originating in blood and culminates in the formation of factor IXa. The extrinsic pathway comprises the activation of factor VII by tissue factor, a membrane bound protein, which is available at the site of vessel injury and culminates in the formation of factor VIIa. Factor IXa and factor VIIa, in concert with tissue factor, catalyzes the conversion of factor X to factor Xa. Thus, the formation of factor Xa represents a convergence of the intrinsic and extrinsic pathways in the cascade of events which lead to blood coagulation.

Fibrinolysis is the mechanism by which the platelet aggregate and fibrin clot is dissolved after the vessel injury has healed. The normal physiological condition results in an equilibrium between blood coagulation and anticoagulation mechanisms preventing hemorrhage while maintaining blood fluidity. A pathological condition leading to the occlusion of a blood vessel, i.e., thrombosis, is the equilibrium tipped in the direction of procoagulation. Arterial thrombosis which deprives tissue of oxygen will result in

-2-

ischemic necrosis of that tissue. Venous thrombosis may result in a pulmonary embolism. Agents which shift the equilibrium towards anticoagulation provide a method for treating and/or preventing thrombosis. Agents which inhibit factor Xa provide a valid pharmacological mechanism for effecting anticoagulation.

The disclosures of these and other documents referred to throughout this Application are incorporated herein by reference.

The compounds of this invention are factor Xa inhibitors and, as such, are useful for treating diseases in which factor Xa activity contributes to the pathology and/or symptomatology of the disease. Uses for factor Xa inhibitors include therapy in treating venous thromboembolism (obstruction of a blood vessel with thrombotic material carried by the blood stream from the site of origin to plug another vessel), to reduce the risk of myocardial infarction in patients with unstable angina, to ameliorate further loss of cardiac function in patients with acute myocardial infarction, to reduce the risk of occlusion of saphenous grafts, to reduce periprocedural thrombosis in patients undergoing angioplasty procedures, to reduce the risk of ischemic stroke in patients with atrial fibrillation, to reduce the risk of embolism associated with mechanical heart valves and valvular heart disease, to prevent ischemic strokes in patients with cerebrovascular atherosclerosis, in patients with peripheral vascular disease, and the like.

Suitable *in vitro* assays for measuring factor Xa activity and the inhibition thereof by test compounds are known. Typically, the assay measures factor Xa induced hydrolysis of a peptide base substrate. Suitable *in vivo* and *ex vivo* models for measuring the anti-coagulation activity of test compounds are known to those of ordinary skill in the art. For further details of the assays for measuring factor Xa inhibitor and/or anticoagulant activity see Examples 18, 19 and 20, infra.

In general, compounds of Formula I will be administered in therapeutically effective amounts via any of the usual and acceptable modes known in the art, either singly or in combination with another therapeutic agent. A therapeutically effective amount may vary widely depending on the severity of the disease, the age and relative health of the subject, the potency of the compound used and other factors. For example, therapeutically effective amounts of a compound of Formula I for anticoagulant therapy may range from 0.1 micrograms per kilogram body weight (µg/kg) per day to 1 milligram per kilogram body weight (mg/kg) per day, typically 1 µg/kg/day to 0.1 mg/kg/day. The dehydroxylation can be effected by reacting the *N*-hydroxycarboxamidine with zinc in the presence of acetic acid at reflux temperature and requires 3 to 4 hours to complete (see Example 13, infra.).

In general, the starting materials required for preparing the compounds of Formula I are either commercially available or can be readily prepared by methods known to those of ordinary skill in the art or as described herein. For example, compounds of Formula 1 or Formula 3 in which L is ethoxy, X³ is -CH₂- and X¹ and X² or X⁴ and X⁵ are adjacent members of an imidazole, thiazole or oxazole ring can be prepared by reacting an appropriate compound of Formula 4 or Formula 2, respectively, with ethyl

ethoxycarbonimidoylacetate hydrochloride. The reaction is carried out in the presence of a suitable solvent (e.g., anhydrous ethanol) at 80 °C and typically requires approximately 18 hours to complete (see Example 2, infra.).

Compounds of Formula 2(a) can be prepared by reducing a corresponding 2-nitroaniline. The reduction can be effected with catalytic hydrogenation in the presence of a suitable catalyst (e.g, 10% palladium on carbon) and in a suitable solvent (e.g., methanol, ethanol, acetic acid, etc.) and requires 3 to 24 hours to complete (see Examples 3, 4, 5 and 6, infra.).

Compounds of Formula 2(a) in which R⁴ is -OR, -NRR' or -SR, wherein R and R' are independent or together with the nitrogen atom to which they are attached form heterocycloalkyl, can be prepared by reacting a correspondingly appropriate amine, alcohol, thiol or heterocycloalkane with a corresponding halo-substituted nitroaniline and then reducing. The reaction with the halo-substituted nitroaniline typically is carried out in a suitable solvent (e.g., THF) at 0 to 25 °C and requires 4 to 5 hours to complete (see Example 3, infra.).

Compounds of Formula 2(a) in which R¹⁰ is -NHR⁵ can be prepared by reacting a correspondingly appropriate amine of the formula NH₂R⁵ with a corresponding 1-halo-2-nitrobenzene and then reducing. The reaction with the 1-halo-2-nitrobenzene typically is carried out in a suitable solvent (e.g., dimethyl sulfoxide) at 0 to 25 °C and requires 4 to 5 hours to complete (see Example 4, infra.).

Compounds of Formula I may be prepared as pharmaceutically acceptable acid addition salts by reacting the free base forms of a compound of Formula I with a pharmaceutically acceptable inorganic or organic acid. Alternatively, the pharmaceutically acceptable base addition salts of compounds of Formula I may be prepared by reacting the free acid forms of compounds of Formula I with pharmaceutically acceptable inorganic or organic bases. Inorganic and organic acids and bases suitable for the preparation of the pharmaceutically acceptable salts of compounds of Formula I are set forth in the definitions section of this Application. Alternatively, the salt forms of the compounds of Formula I may be prepared using salts of the starting materials or intermediates.

The free acid or free base forms of the compounds of Formula I can be prepared from the corresponding base addition salt or acid addition salt form. For example, compounds of Formula I in an acid addition salt form may be converted to the corresponding free base by treating with a suitable base (e.g., ammonium hydroxide solution, sodium hydroxide, etc.). Compounds of Formula I in a base addition salt form may be converted to the corresponding free acid by treating with a suitable acid (e.g., hydrochloric acid, etc).

The N-oxides of compounds of Formula I can be prepared by methods known to those of ordinary skill in the art. For example, N-oxides can be prepared by treating an unoxidized form of the compound of Formula I with an oxidizing agent (e.g., trifluoroperacetic acid, permaleic acid, perbenzoic acid, peracetic acid, meta-chloroperoxybenozic acid, etc.) in a suitable inert organic solvent (e.g., a halogenated such as methylene chloride) at approximately 0 °C. Alternatively, the N-oxides of the compounds of Formula I can be prepared from the N-oxide of an appropriate starting material.

Compounds of Formula I in unoxidized form can be prepared from N-oxides of compounds of Formula I by treating with a reducing agent (e.g., sulfur, sulfur dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, etc.) in an suitable inert organic solvent (e.g., acetonitrile, ethanol, aqueous dioxane, etc.) at 0 to 80 °C.

Prodrug derivatives of the compounds of Formula I can be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier *et al.* (1994), *Bioorganic and Medicinal Chemistry Letters*. 4:1985).

Protected derivatives of the compounds of Formula I can be made by means known to those

of ordinary skill in the art. A detailed description of the techniques applicable to the creation of protective groups and their removal can be found in T.W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, Inc. 1981.

Compounds of Formula I can be prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereomeric compounds, separating the diastereomers and recovering the optically pure enantiomer. While resolution of enantiomers can be carried out using covalent diastereomeric derivatives of compounds of Formula I, dissociable complexes are preferred (e.g., crystalline diastereoisomeric salts). Diastereomers have distinct physical properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and can be readily separated by taking advantage of these dissimilarities. The diastereomers can be separated by chromatography or, preferably, by separation/resolution techniques based upon differences in solubility. The optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization. A more detailed description of the techniques applicable to the resolution of stereoisomers of compounds from their racemic mixtures can be found in Jean Jacques, Andre Collet, Samuel H. Wilen, Enantiomers, Racemates and Resolutions, John Wiley & Sons, Inc. (1981).

EXAMPLE 11

2-(6-Fluoro-4-imidazol-1-yl-1*H*-benzoimidazol-2-ylmethyl)-1*H*-benzoimidazole-5-carboxamidine (Compound 60),

a compound of Formula I in which A together with B comprises 5-amidino-

18 1*H*-benzoimidazol-2-yl, C comprises 6-fluoro-4-imidazol-1-yl-1*H*-benzoimidazol-2-yl and X^3 is $-CH_2$ -

A mixture comprising ethyl (5-amidino-1*H*-benzoimidazol-2-yl)acetate

hydrochloride (1.34 g, 4.73 mmol), 6-amino-4-fluoro-2-(1*H*-imidazol-1-yl)aniline (1.0 g, 4.73 mmol) and DMPU (3 mL) was heated in a sealed tube for 2 hours at 175 °C. The mixture was cooled to 60 °C, diluted with methanol (3 mL) and then added dropwise to vigorously stirring acetonitrile (300 mL) to give a precipitate. The precipitate was collected and dried under vacuum. The residue was dissolved in 1N hydrochloric acid and purified by reverse-phase C-18 HPLC (2-27% gradient) to give 2-(6-fluoro-4-imidazol-1-yl-

27 1*H*-benzoimidazol-2-ylmethyl)-1*H*-benzoimidazole-5-carboxamidine (600 mg, 1.12 mmol), MS (BIOION), Calculated for C₁₉H₁₅FN₉: MH⁺: 374.37; Found: MH⁺: 375.8.

A mixture comprising 3-methoxy-4-nitrobenzoic acid (42.0 g, 213 mmol) and thionyl chloride (75 mL, 122.3 g, 1.03 mole) was heated at reflux for 90 minutes, cooled to ambient temperature, concentrated by short-path distillation and cooled to provide a

precipitate. The precipitate was isolated and dried to provide 3-methoxy-4-nitrobenzoyl chloride (45.9 g,

quantitative) as a light tan solid.

A solution of the 3-methoxy-4-nitrobenzoyl chloride in methylene chloride (300 mL) was cooled to 0 °C and a mixture of *tert*-butyl amine (26.9 mL, 256 mmol, 1.2 equiv), triethylamine (35.7 mL, 256 mmol, 1.2 equiv) and methylene chloride (100 mL) was added dropwise. The mixture was warmed to ambient temperature, concentrated to a slurry and partitioned between ethyl acetate and water. The organic layers were separated, dried (anhydrous sodium sulfate) and concentrated to provide

N-tert-butyl-3-methoxy-4-nitrobenzamide (51.5 g, 204 mmol) as an off-white solid.

The *N-tert*-butyl-3-methoxy-4-nitrobenzamide and sodium chloride (60.0g) was dissolved in 1,2-dichloroethane (250 mL) and then POCl₃ (12.45 mL, 0.134 mol, 1.1 equiv) was added dropwise to the solution at ambient temperature and under an atmosphere of nitrogen. The mixture was heated at reflux for 18 hours, then cooled to ambient temperature and poured onto a 1:1 mixture of methylene chloride and ice (200 mL each). The organic layer was separated and washed with aqueous saturated NaHCO₃ solution (3x), dried (anhydrous MgSO₄) and concentrated to provide 3-methoxy-4-nitrobenzonitrile (20.6 g, 0.117 mol) as a dark tan solid.

The 3-methoxy-4-nitrobenzonitrile (55.0 g, 309 mmol, 1 equiv) was dissolved in dimethyl sulfoxide (150 mL) and then ethanolamine (21.4 mL, 355 mmol, 1.15 eq) was added to the solution. The mixture was heated at 80 °C for 4 hours, cooled to ambient temperature and poured onto ice/brine to give an orange/red precipitate. The precipitate was collected, washed with water and dried to provide 3-(2-hydroxyethylamino)-4-nitrobenzonitrile (54.1 g, 262 mmol) as a red solid.

A mixture comprising 3-(2-hydroxyethylamino)-4-nitrobenzonitrile (30.2 g, 146 mmol, 1 eq), phthalimide (23.6 g, 160 mmol, 1.1 eq), triphenylphosphine (42.1 g, 160 mmol, 1.1 eq) and anhydrous THF (500 mL) under an atmosphere of nitrogen was cooled to 0 °C and then diethyl azodicarboxylate (25.2 mL, 0.16 mol, 1.1 eq) was added. The reaction was allowed to proceed 30 minutes and then the mixture was poured onto diethyl ether (1 L) to give a precipitate. The precipitate was isolated and dried to provide 3-[2-(1,3-dioxo-1,3-dihydroisoindol-2-yl)ethylamino]-4-nitrobenzonitrile (39.3 g, 117 mmol) as a yellow solid.

A biphasic mixture comprising 3-[2-(1,3-dioxo-1,3-dihydroisoindol-2-yl)ethylamino]-4-nitrobenzonitrile (38.5 g, 114 mmol, 1 eq), Na₂S₂O₄ (119.6 g, 689 mmol, 6 equiv), water (600 Ml) and THF (600 mL) was stirred vigorously at ambient temperature for 1 hour. The organic layer was separated and concentrated to near dryness. The residue was suspended in saturated aqueous NaHCO₃ solution and the suspension was stirred for 20 minutes. The solid material in the suspension was isolated by filtration, washed with water and dried to provide 4-amino-3-[2-(1,3-dioxo-1,3-dihydroisoindol-2-yl)ethylamino]benzonitrile (29.7 g, 97.0 mmol) as a tan solid.

A solution comprising 4-amino-3-[2-(1,3-dioxo-1,3-dihydroisoindol-2-yl)ethylamino]benzonitrile (6.50 g, 21.0 mmol, 1 eq) in acetic acid (250 mL) was warmed to 80 °C and ethyl ethoxycarbonimidoylacetate hydrochloride (7.26 g, 370 mmol, 1.75 eq) was added. The reaction was allowed to proceed 3 hours and then the mixture was concentrated to 75 mL, diluted with water (250 mL), basified with NH₄OH to pH 10 and extracted ethyl acetate. The extract was dried (anhydrous sodium sulfate), filtered, concentrated to a slurry and poured onto diethyl ether (300 mL) to give a precipitate. The precipitate was collected and dried to provide ethyl 6-cyano-1-[2-(1,3-dioxo-1,3-dihydroisoindol-2-yl)ethyl]-1*H*-benzoimidazol-2-ylacetate (6.04 g, 15 mmol) as a tan solid.

Mixtures of human Factor Xa (0.5-5 nM) and test compound (varying concentrations) in assay medium (comprising: Tris, 50 mM (pH 8); NaCl, 1M; CaCl₂, 5 mM; polyoxyethylenesorbitan monolaurate (Tween-20), 0.05%; DMSO, 10%; and zinc chloride, 150μM) were incubated for 1 hour at room temperature and then substrate, MesOC-Norleu-Gly-Arg-pNA, was added such that the final concentration of the substrate in the assay mixture was between 0.5 and 5 mM. Hydrolysis of the substrate was followed spectrophotometrically at (405 λ) for 5 minutes. Apparent inhibition constants (K_i) were calculated from the enzyme progress curves using standard mathematical models.

Ex vivo ACT Assay

Rabbits were sedated with Hypnorm® (fluanisone 10 mg/mL and phentanylcitrate

0.315 mg/mL; 0.05 mL/kg, i.m.). A catheter (Venflon®2, Ø 0.8/25 mm) was inserted into a
marginal ear vein for adminstration of test compound. A second catheter (Venflon®2,
Ø 1.0/32 mm) was inserted into the artery of the other ear for blood sampling. Test

compounds were administered by i.v. bolus injection. Blood samples were collected (0.5
mL) prior to adminstration of test compounds and at various time points thereafter.

The activating clotting time (ACT), the amount of time for clot formation, was measured with a Medtronic Automated Coagulation Timer ACT II. An aliquot (200 μ L) of

the blood sample was added to each of two reaction chambers of a disposable two-channel test cartridge containing assay buffer (comprising: 0.75% kaolin, as the activator, and

- 0.0025M CaCl₂ in 0.1 mL HEPES buffer for non-citrated blood and 2.2% kaolin and 0.05M 3 CaCl₂ in 0.1 mL HEPES buffer for citrated blood). Clot formation was measured as a decrease in the downward motion of a plunger assembly contained by the test cartridge.
- 6 The decrease in downward motion of the plunger was detected by a photo-optic system. The concentration of test compounds necessary to double ACT was determined.

Proceeding as described in Example 19, compounds of the present Invention were assayed and found to increase.

EXAMPLE 20

In vitro ACT Assay

Rabbit blood was collected from an indwelling catheter in a ear artery into plastic 12 containers. Human blood was collected via venipuncture into vacutainers, some of which contained 0.5 mL of 3.8% citrate. ACT was measured as described in Example 19. Blood samples were mixed with varying concentrations of test compounds dissolved in 15 physiological saline (30µL for non-citrated blood and 15µL for citrated blood). Noncitrated blood was used in the assay immediately upon its collection. Citrated blood was kept at ambient temperature for 0.5 to 2 hours and then incubated at 37 °C before used. The 18 concentration of test compounds necessary to effect a doubling of the ACT (EC_{x2}) was determined.

Proceeding as described in Example 20, compounds of the present Invention were 21 assayed and found to have the following EC_{x2} values:

Box i	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This Inte	ernational Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
1. X	Claims Nos.: 11 because they relate to subject matter not required to be searched by this Authority, namely: Remark: Although claim 11 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged
2. X	effects of the compound/composition. Claims Nos.: NOT APPLICABLE because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically: see FURTHER INFORMATION sheet PCT/ISA/210
з. 🗌	Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)
This Inte	rnational Searching Authority found multiple inventions in this international application, as follows:
1.	As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.	As all searchable claims ocuid be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.	As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.	No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark	on Protest The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Claims Nos.: NOT APPLICABLE

In view of the extremely broad Markush claims, the search was executed with due regard to the PCT Search Guidelines(PCT/GL/2), C-III, paragraph 2.1,2.3 read in conjunction with 3.7 and rule 33.3 PCT, i.e. particular emphasis was put on the inventive concept, as illustrated by:

The compounds of claims 3-9 and particularly the compounds of the examples

The international search was in so far as possible and reasonable complete in that it covered the entire subject-matter to which the claims are directed.
